

## Name and Description

The name of my website will be frederickschein.github.io. I plan on making a resume website for myself to be able to use in the future. I want to have a website for my own personal use that provides employers with the ability to easily access all my information that may be required for employment. The page will be well designed and organized for ease of use and will be able to showcase my web design skills by the look and feel of it. The website won't just include basic resume information it will include more detailed information about code and coding projects I have been and will be a part of. It will be important that this website is easily adjustable and that additions can be made to build upon what I put on it today.

## Pages

- Home (will include basic information and links to important pages)
- Resume (will include my resume and it will be clickable to access a pdf version of the resume)
- Example Code (will include example code for languages I have learned and will include a link to github)
- Coding Projects (will include descriptions of coding projects I have been a part of and what my role was in the project)
- About Me (will include personal information)

## Data Storage

The website will store example code files such as .java, .cc, .html, .css, and .js files for example. It will also store images in either .jpg or .png files as well as .pdf files. These files will be clickable, so employers can further view, download, and even print if needed. The website will also contain links to other important websites such as my github or linkedin which will give the employer easy access to all my required information.
